

Delivery "just in time" is not a demand that is restricted to the automobile industry. Seal ring manufacturers are being confronted more and more frequently with demands for shorter delivery times combined with maximum performance. A similar situation exists for operators of industrial pumps and other machinery, who find themselves faced with production interruptions due to seal failures. Both carbon graphite and SiC are materials with an important influence on performance and reliability. Lead time for these components may have been weeks in the past, but those same components are now required in days.

Our Seal Ring Express program for carbon graphite products is specifically focussed on short lead times and rapid delivery.

Efficient processes, proper raw material selection, large inventory and precise machining methods allow us to offer this service.

The specialized knowledge of our experienced staff combined with the most modern processing equipment available assure you of the highest quality parts.

Seal Ring Express is designed for the standard materials and impregnations, common size parts, in quantities up to 50 pieces.
